	B. In	Some servers might not have all source files available to add all roles, role services, or features. The source files might not have been installed, or might have been removed by users after the operating system was installed.	
	Si Si	If the server on which you want to install roles or features does not have all required source files, the server can try to get files by using Windows Update, or from a location that is specified by Group Policy.	they have evious to clear
	Fe C Ri	You can also specify an alternate path for the source files, if the destination server does not have them. The source path or file share must grant Read permissions either to the Everyone group (not recommended for security reasons), or to the computer (local system) account of the destination server; granting user account access is not sufficient.	
		The following are examples of a valid source file path where the destination server is the local server, and where the E: drive contains the Windows Server installation media.	
		Source files for .NET Framework 3.5 Features are not installed as part of a typical installation, but are available in the side-by-side store (SxS) folder: E:\Sources\SxS\	
		Source files for other features are available in the Install.wim file. Add the WIM: prefix to the path, and a suffix to indicate the index of the image from which to get source files. In the following example, the index is 4: WIM:E:\Sources\Install.wim:4	
		Path: C:\Users\Administrator\Desktop\sxs
